Fed-batch culture is, in the broadest sense, defined as an operational technique in biotechnological processes where one or more nutrients are fed to the bioreactor during cultivation and in which the product remain in the bioreactor until the end of the run. An alternative description of the method is that of a culture in which "a base medium supports initial cell culture and a feed medium is added to prevent nutrient depletion". It is also a type of semi-batch culture. In some cases, all the n

Fed-batch culture - Wikipedia

utilization of fed-batch fermentation as compared with batch fermentation implies an increase in productivity and a concomitant decrease in product manufacturing cost. For example calculations reported later, referring to penicillin G, increase in productivity is 12.7% and decrease in manufacturing cost is about 8%. Fed-batch fermentation is distinguished from batch

Fed-batch versus batch fermentation - Home - Springer

Batch fermentation is one type of industrial fermentation in which products are harvested at batch wise while stopping the process at the end of each batch. In batch fermentation, in the beginning, nutrients and microorganisms are added and run the process. It is a closed system and relatively a large fermenter is used.
