The authors' approach is to develop the subject of probability theory and stochastic processes as a deductive discipline and to illustrate the theory with basic applications of engineering interest. Approximately 1/3 of the text is new material--this material maintains the style and spirit of previous editions.

A renewal (counting) process  $\{N(t), t \geq 0\}$  is a nonnegative integer-valued stochastic process that registers the successive occurrences of an event during the time interval  $(0, t)$ , where the time durations between consecutive events are positive, independent, identically distributed random variables. Presently,

the subject is viewed as the study of general functions of independent, identically distributed, nonnegative random variables representing the successive intervals between renewals.
