The objectives of this paper are to describe the ultrasonographic anatomy of the median nerve and the technique for performing an ultrasound-guided anaesthetic block of the nerve. The median nerve is imaged using a microconvex (or linear) probe in transverse section performed proximally to the chestnut on the medial aspect of the forearm. Distribution of the anaesthetic solution around the nerve is done by initially inserting the needle caudally and then cranially to the nerve and ...

Ultrasound-guided perineural dextrose injection (PDI) has been reported effective for carpal tunnel syndrome (CTS). Higher volume of injectate may reduce adhesion of median nerve from other tissues, but volume-dependent effects of PDI in CTS remain unknown. We aimed to investigate whether PDI with different injectate volumes had different effects for CTS participants.

For all peripheral nerve blocks, a high frequency linear array ultrasound (9-18 MHz) is used. Peripheral nerves have a variable sonographic echotexture that is affected by the surrounding tissue. Classically, nerve fascicles itself appear hypoechoic embedded within a more hyperechoic and homogenous perineurium and endoneurium.

~~Ultrasound Guided Nerve Block – Overview~~

Nerve Block Given the very superficial lie of the median nerve in the carpal tunnel, an out of plane approach is generally preferred. The needle is inserted perpendicular to the ultrasound plane. Once the needle tip is identified, it is slowly directed to one side of the median nerve.

~~Median Nerve Block – ACEP~~

Ultrasonographic assessment shows that a median nerve block using nerve stimulation alone is commonly associated with intraneural injection. Some authors have suggested additional indications for forearm blocks, in combination with a proximal brachial plexus block.

To provide prompt and effective analgesia, either as a local anaesthetic prior to suturing or following injury (such as femoral nerve block for a broken leg) To facilitate proper examination, intervention or mobilization of an injured area without the need for sedation or general analgesia; Nerve blocks are injected near the nerves using ultrasound.

~~Medical Billing and Coding Peripheral Nerve Blocks~~

Traditional wrist block technique involves advancing needles using surface landmarks toward the three nerves that supply the hand, namely the median, ulnar, and radial nerves. The ultrasound-guided approach has the advantage of direct visualization of the needle and target nerve, which may decrease the incidence of needle-related trauma.
